A linked list is a linear data structure, in which the elements are not stored at contiguous memory locations. The elements in a linked list are linked using pointers as shown in the below image:

In simple words, a linked list consists of nodes where each node contains a data field and a reference(link) to the next node in the list.

If you still need more assistance with your placement preparation, have a look at our [Complete Interview Preparation Course](#). The course has been designed by our expert mentors to help students **crack the coding interview of top product or service-based organizations** . You get access to **premium lectures, 200+ coding questions bank, resume building tips, and lifetime access** to the course content. So to make sure that your next programming interview doesn't feel like an interrogation, enroll in [Complete Interview Preparation](#) and give a boost to your placement preparation.
